

When an intruder moves across the ground above a buried fiber optic sensor cable, whether walking, running, or crawling, characteristic vibrations are created. The system distinguishes these from ...

Answer: A fiber optic intrusion detection system detects disturbances or vibrations along a fiber optic cable. These disturbances are caused by intrusions, such as fence climbing, digging, or cutting, ...

Monitor temperature, strain, or vibration around the clock in real-time with a fiber optic sensing system. Fiber optic sensing monitors a fiber optic cable from a single location via pulses of light traveling ...

The equipment connected with the detector can judge the position, thus giving alarm to the safety watchman. When intrusion occurs, the system will alarm ...

FiberSensor(TM) detects intrusion attempts at existing fence or palisade barriers by means of motion and vibration disturbance. To provide uniform detection and to enhance sensitivity, the sensor cable is ...

The equipment connected with the detector can judge the position, thus giving alarm to the safety watchman. When intrusion occurs, the system will alarm immediately and locate the alarm position ...

The RaySense system can monitor the vibration signals along the length of the fiber optic cable, locate an intrusion event, and classify the specific signatures based on the detection algorithm.

Fiber Optic Distributed Vibration Sensing (DVS) technology offers groundbreaking features for security and safety applications. These systems detect vibrations across a wide area through sensitive fiber ...

Due to its easy deployment and cost-effectiveness, the vibration optical cable is suitable for detecting various intrusions along long-distance fences, such as irregular and sheltered fences.

Fiber Optic Distributed Vibration Sensing (DVS) technology offers groundbreaking features for security and safety applications. These ...

The Vibration Fiber Optic Perimeter Alarm System is a high-precision intrusion detection solution used in critical infrastructure such as chemical storage facilities, refineries, and secured industrial zones.

To monitor for ground shifts and potential rupture points, an energy company installed optical fiber vibration sensors along a remote pipeline route. The system enabled real-time alerts on vibration ...
