

# The aggregation switch can connect to the NB-IoT system

This configure instruction is for Dragino NB-IoT models with -NB or -NS suffix, for example DDS75-NB. These models use the same NB-IoT Module BC660K-GL and has the same ...

Going beyond the Wi-Fi 6 (802.11ax) standard, the Catalyst 9124AX Series provides integrated security, resiliency, and operational flexibility as well as increased network intelligence.

Understand NB-IoT network architecture, its components, interfaces, and data flow for telecom professionals and IoT engineers.

For downlink synchronization in case of NB-IoT, the two LSB of the ARFCN is signalled in MIB for bands for which a 200 kHz channel raster is not supported, and the legacy 100 kHz raster is used.

An LTE operator can deploy NB-IoT inside an LTE carrier by allocating one of the Physical Resource Blocks (PRB) of 180 kHz to NB-IoT. As will become clear later in this article, the air interface of NB ...

The carrier for the initial connection setup is called Anchor carrier and the other carriers are called Non-Anchor carrier. When NB-IoT is operating in "inband with the same PCI" mode, only a specific PRB ...

This IoT platform stores uplink datagrams from the NB-IoT module. The customer server communicates with the IoT platform to retrieve uplink datagrams and to send downlink datagrams to the NB-IoT.

The device can wake up when it needs to send data, and is reachable for downlink for a brief time interval after each data transfer. Because the device remains registered in the network, it does not ...

Why can't the password access AT command after upgrade(-NB)? or keep the password to restore the rest of the parameters to factory Settings. This update changes the password address of the ...

This message is usually considerably smaller than the corresponding LTE message, because all LTE features which are not supported in NB-IoT, like further access technologies or carrier aggregation, ...
